The Evolution of SMB Security

Let's face it -- in the fight against cybercriminals, antivirus tools are no longer enough. As hackers develop new ways of bypassing legacy systems, infiltrating environments, and deploying malicious software, small and medium businesses (SMB) need to adapt a more integrated and holistic approach to security.

Our managed detection and response (MDR) offering provides the added layer of security you need to stop hackers in their tracks if they were to get past your antivirus.

Developed by former NSA cyberwarfare operators, our MDR platform combines powerful automated threat hunting technology from a team of security experts. It's the perfect complement to your existing security stack by identifying threats that would otherwise go unnoticed and preventing bad actors from dwelling in your network.

Invisible to User
This cloud-based solution send data to the cloud for analysis and triage, if necessary; this process is invisible and non-distruptive.

Enhanced by Algorithms
This process is not exclusive to human eyes nor to algorithms; instead, algorithms enable humans to prioritize threat detection and act accordingly.

Backup Protection
This process does not replace antivirus protection, but it does complement it to ensure a more comprehensive security stack.

Antivirus + MDR = A Smarter Approach for SMBs

	Antivirus	MDR
Protects Users Without Interruption	✓	
Prevents Known Malicious Threats	✓	✓
Minimizes Downtime & Data Loss Risk	✓	
Proactively Hunts Anomalous Threats	✓	✓
Triages Events with Human Analysis		✓
Prioritizes Alerts with Business Context		✓
Delivers Resilience & Remediation		✓

Our managed dectection and response offering provides the added layer of security you need to stop hackers in their tracks once they've slipped past your antivirus.
