tigunia Take Control of Your Finance and Operations

D365 Hosting with Tigunia

Are you looking for better control of your **Dynamics 365 Finance** or D**ynamics 365 Supply Chain Management** systems? Many organizations are hosting their Finance & Operations data using a SaaS solution, but there is another option. With on-premises solutions hosted with a third-party or on your own, you can quickly reach performance and reporting standards that you would otherwise be cut off from using in a SaaS environment. If you're sick of not having direct access to your Finance & Operations database, even after spending a large amount of money and time implementing your system, Tigunia has the solution for you.

A SaaS solution is not right for everybody, especially for those organizations with strict performance and data management expectations. When you host your Finance & Operations solution with Tigunia, you have significantly better reporting options. You gain direct SQL access and proper analytics without the need for data lakes or Bring-Your-Own-Device (BYOD) restrictions. In other words, this is data warehousing made easy. Clone your production and take it with you, whenever and wherever you may need it. This data can integrate with all of your other data systems and services, allowing you to use the reporting tools that you want. All of this control over your data is backed by Tigunia's world-class data management and customer support tools, available 24/7/365.

The Tigunia Difference

Direct-to-tech support
Clients have access to dedicated experts for infrastructure support.

Better Reporting
When you deploy on-premises, you gain the reporting options that you've always wanted.

Control Your Performance
Scale your environment when you need it and work from a private, purpose-built cloud.

Hosting Your F&O Data with Tigunia

Do you feel like your operations are slowed down by your current Finance & Operations performance? These applications are designed for scalability of core entities, such as the web client, web services, batch jobs, and automation. When hosting with Tigunia, you can scale production where you need to, on your own schedule. You get a purpose-built, private cloud for high performance ERP applications. Rest easy knowing that your deployment is configured to meet your specific business and security requirements, and can support your organization's data backup restoration point and restoration time objectives.

- Receive the support you need in debugging performance issues with telemetry.
- Keep your data secure in the event of a disaster with SQL backups for rapid transactional or full database restore, and system level backups for rapid restore of application components.
- We assist with LCS support so you can bypass Microsoft's support services.
- Get support for compliance and regulatory adherence with Tigunia's customization and tailored on-premises options.

Keep the same level of control as your AX environment. With Tigunia's co-management, you can manage as much or as little of the application as you need.
