

tigunia Enterprise Platform Reporting

One Platform, One Hundred Reports

Enterprise Platform Reporting gives you the best in security reporting. It collects detailed information on every asset, including those not physically connected to the network, and identifies all risks from misconfigurations, network vulnerabilities, and user threats. It supports all environments, from on-premises to remote and cloud environments; it also easily integrates into a remote and dispersed infrastructure for a remote workforce. These reports are easy to present and support recurring assessment to adapt instantly to change, all at a simple price point.

The reports can be edited and customized to your heart's content. To make it easy, we organize our reports in two different ways: You can view reports by the type of assessment you are running, such as Network, Security, Exchange, SQL Server or MS Cloud, or you can view them by use case, such as for prospecting, onboarding and discovery, service optimization, et cetera. The document contains the technical details about the network and its configuration, as well as some suggestions regarding improvement.

Light-weight and Ready for All Environments

Execute reporting with no software installation

Gather data from in-office and remote endpoints

Data collection and reports can export in a variety of formats

Complete IT assessment to keep you informed

Enterprise Platform Reporting's unique architecture makes it fully functional for one-off assessments for prospecting and paid projects, as well as for regularly scheduled automated assessments for your managed services clients. Either way, the system relies on non-intrusive data scanners that quickly pull in and encrypt a massive amount of network, cloud, asset and user data. The data is then automatically analyzed, filtered and can be presented in 100 different reports based on what you need to know and show.

- ✔ Get great value and ease-of-operation by offering truly comprehensive assessment and reporting and exhaustive vulnerability scanning.
- ✔ Present innovative recommendations for performance process improvements that can help your business realize its highest possible potential by increasing its efficiency, productivity, and bottom line.
- ✔ Remediate recurring issues by gaining visibility into processes and programs across your organization's entire infrastructure.
- ✔ Analyze your existing technologies including hardware, infrastructure, and software solutions so your management has a clear understanding of its current state and how business processes are currently being accommodated.
- ✔ Accessible reporting features can keep your technical resources happy by eliminating burdensome reporting and copywriting.
- ✔ Track your network health with analysis and reporting as often as you'd like - annually, quarterly, monthly, or weekly.
